Ten Changes in Cyber Regulation: Number Six Will Shock You

Global financial sector regulators are treating cybersecurity as a top priority. Their interests range from limiting the risk of systemic failure to protecting customers from fraud and privacy incidents. The last few years have been used to gather information and consolidate understanding and now new waves of prescriptive requirements are beginning to land. This fast-moving topic is challenging to regulate and this light-hearted presentation takes a click-bait fueled look at how to get the most from current and future regulation and what we can expect on the horizon.

The Year in Cyber: Annual Review & Predictions

What has 2017 brought to the finance sector? The repurposing of sophisticated tools for high-scale ransomware attacks, suspected nation-state watering hole campaigns across regions, copycat DDOS extortionists, network-based ATM attacks, and other threats. It also saw the growth of FS-ISAC in the region, bringing new products to members and services like the Weekly Watch Reports and the new EMEA Business Resilience Council. Join FS-ISAC Staff and members in a discussion over what the past year has seen and where the threat landscape is headed in the near future.

Red Teaming the C-Suite: The Ultimate InfoSec Awareness Program

The sad truth is that cybersecurity awareness programs can be stale, boring and ineffective leaving many employees and managers to grudgingly complete their annual training requirement without really understanding the importance of good cyberhygiene. And while you may hold periodic table top exercises to test your cybersecurity incident response plan, often the C-Suite is not fully engaged. Red teaming the C-Suite will bring buy-in from your company's executive leadership team by making cybersecurity personal and tangible, not some abstract discussion point in a slide deck. This presentation will look at ways your internal cybersecurity team can conduct red team exercises on a budget that will engage your C-Suite and hopefully increase their awareness and advocacy (funding!) for your cybersecurity program.

Know Thy Enemy: Views from the Deep and Dark Web Underground

The deep and dark web (DDW) is a rich source of data full of black market products and services, weapons and training manuals, malicious TTPs and dialogue between threat actors. Threatening activity from the most difficult to access and high-risk areas in the DDW can harm an organization's business, stakeholders, employees and customers.
This session will outline some of the challenges involved in effectively tracking and monitoring threats on the DDW including dispelling common myths surrounding attackers operating within these communities and providing insight into their mindsets and motivations through examples from past and current events.

Offline and Local: The Hidden Face of Cybercrime

The conventional wisdom is that cybercrime is a largely anonymous activity that exists essentially in cyberspace. The supposed anonymity of attackers feeds into a narrative that cybercrime is strange, new, ubiquitous and ultimately very difficult to counteract. The central purpose of this presentation is to dispute this view. When one looks for it, there is actually a strong offline and local element within cybercrime, alongside the online dimension. In order to investigate this claim and its implications for policing, the core of this presentation is dedicated to a case study from Romania.

Lessons Learned from the Frontlines: Responding to WannaCry and Petya

In this session, we will discuss the lessons learned by Microsoft in responding to the WannaCrypt and Petya attacks. This session will evaluate the techniques utilized to carry out these attacks and examine the specific mechanisms used by the malware to spread once inside an organization. We will also evaluate and share the technical guidance for responding to such attacks and explain the best practices we derived from our post mortem, incident response activities for making organizations more resilient against these and similar attacks. Future innovations and areas for information sharing and global collaboration to address such threats will be discussed.

Defending Against Phishing: Preparing and Using Human Sensors

As the security industry has continued to under invest in the human element of security, phishing has become the top attack vector for cybercriminals. Breaches continue to occur in record numbers, detection takes an excessively long and the most preferred targets are an organization's human assets. Empowering human assets to provide vetted intelligence to your incident response teams is often overlooked. In this presentation, learn about recent phishing attacks, how businesses can reduce susceptibility to human-targeted attacks by providing immersive simulated phishing and how to empower users to be human sensors that can recognize and report suspected attacks, thus reducing the attack detection window.

What's in your Digital Footprint? A Retrospective on Recent Bank Attacks and High-Profile Vulnerabilities

Organizations have spent massive amounts of money to protect the perimeter of their networks, but if your business exists on the internet, there really is no perimeter. This session will discuss recent attacks on internet-facing assets, such as those on Polish banks in February, as well as critical vulnerabilities that can turn web servers into your worst enemy, like the Apache Struts vulnerability in March. Business and cybercrime are not slowing down – learn how you can be prepared to address these types of threats.

Eliminating Payment System Attacks

Cyber-attacks on financial payment systems have become a fact of life. Watering-hole attacks disseminating web-based malware and targeted spear phishing emails are increasingly utilized by attackers. No matter the size of the security team, institutions of all sizes assume the same amount of risk by allowing employees free access to the web and to click on web and document links in email. Traditional detection-based security products prove ineffective. Security professionals are locked in a cat-and-mouse struggle with smart, motivated, well-financed attackers, where detection-based prevention technology sparks a new generation of attacks to evade defenses. In this session learn methods to prevent payment systems attacks.

Uncovering Fraud Faster and More Effectively

With customers expecting faster and more convenient services, the challenge isn't just intercepting suspicious transactions it's also enabling legitimate transactions to proceed without interruption. To more effectively assess the fraud risk, it requires the ability to view account activity in context across channels. This session will review an approach that helps spot new patterns more quickly, connect the dots to deliver more accurate risk assessments and adaptive intelligence so organizations can adapt faster and apply countermeasures more quickly.

Attacker Resistance: Redefining Risk from a Hacker Perspective

When it comes to understanding your security risk, hope is not a course of action. Today, breaches are leading to stolen financial assets, reputation loss and damage to the business. Unfortunately, traditional models fall short when trying to assess risk. Organizations need to bring hackers in the loop to truly understand the human ingenuity behind an attack and the system's hardness against it. In this session, learn how you can assess your risk from the adversary's perspective, using a crowd of the world's most skilled and vetted ethical hackers paired with groundbreaking vulnerability intelligence technologies.

Real-Time Risk Management

Assessing endpoint risk has become increasingly complex and siloed over the past decade. Security teams and technologies alike must divide their focus between potential and active threats. Compliance efforts yield a strikingly different perspective on the state of an environment than the output of a CSIRT or hunting team. As a result, CISOs often struggle to accurately measure how secure their systems truly are, and which assets merit the most attention. This session will offer a blended approach to evaluating and monitoring endpoint security in real-time, using data points that define the risks attached to systems and their users.

Trends, Predictions & Real-world Tradecraft. The Lessons Learnt in Responding to the Most Advanced Attacks

2017 will be remembered as a year where nation state hacking dominated the media. These attacks are the most challenging that any organization can face because a nation state actor can invest a significant amount of R&D to target an organisation and isn't driven by a profit motive. Yet techniques adopted by these actors invariably find their way into the mainstream criminal world and are a leading indicator of what to prepare for. In this briefing, our speakers look to the year ahead and make predictions of what you should expect to see and how you should focus your resources. Using real-world examples to illustrate the extraordinary tradecraft that is routinely employed to steal state secrets, gain access to critical infrastructure or poach valuable intellectual property, we will expose how the European threat landscape has changed in recent months.

Developing an Intel Sharing Maturity Model

Actively participating in an information sharing community like FS-ISAC is a challenging task. It requires fundamentally rethinking the confidentiality of security relevant information, and takes a lot of effort to integrate external services and processes into your own daily operations.

In order to help our members better prioritize their efforts, and to understand where they can improve the value they gain from their FS-ISAC membership, we propose developing a maturity model for participating in FS-ISAC, or in a similar information sharing initiative. This can be based on existing information security maturity models (e.g. BSIMM), as well as threat intel maturity models available, and will require member input in order to be as relevant as possible. This session is your opportunity to help create a framework that also lets us understand where our members require more support and activity.

Cyber Security and The 323 Year Old Bank: Using Threat Intelligence To Tell Your Story and Inspire Your People

Cyber security is a people challenge every bit as much as is it a technical challenge. Unlike technology, people need motivating, educating and inspiring and when you get this right, your people become your first line of defence. This presentation will show how the Bank of England has used threat intelligence to tell the story of why cyber security matters in a 323 year old organisation and how threat intelligence drives risk, policy, education and investment as well as threat detection.

This presentation will cover:

- Getting dissemination right, making sure that your reports don't just sit on the shelf
- Reaching the heard to reach: Communicating threat intelligence to different audiences
- Specific tips and lessons on executives and board members
- Setting the tone – working with people on day 1 in the organisation
- Driving threat detection using intelligence-based use cases rather than processing IoCs
- The role of threat intelligence in education and awareness

From Compliance to Culture, from Awareness to Action

Most organisations now agree that as part of a rounded cyber defence programme, staff awareness, training and education have a large part to play. So why isn't it working? In this session John Scott will discuss why focussing on awareness isn't enough, and why successful organisations need to look at behavioural and ultimately cultural change to turn their people from the weakest link to the strongest. He will share the approach the Bank of England has taken on this and look at what simple steps any organisation can take to make their staff the first line of defence.
